

Lab Reflection Report: Money Detective

1. Executive Summary

- **Project Title:** Money Detective
- **Problem Solved:** This project focused on financial health management by identifying recurring charges, tracking forgotten subscriptions, and flagging duplicate payments to help users gain better control over their personal finances.
- **AI Tool Used:** ChatGPT

2. Prompting Strategy

Initial Prompt

"Write a script which find the recurring charges, forgotten subscription and duplicate payments."

Prompt Iterations

No significant iterations were required for this specific task. The model provided a functional script based on the initial request, and no further refinement was needed to achieve the expected output.

3. Performance Analysis

Aspect	Findings
What Worked Well	The initial prompt was sufficiently clear to allow the model to generate a functional script in a single iteration.
What Did Not Work	There were no major failures or roadblocks encountered during the generation of this script.
Challenges Faced	No significant challenges were reported, as the model successfully interpreted the objective on the first attempt.

4. Verification & Results

- **Verification Method:** The results were verified by manually cross-referencing the identified transactions against known financial data, specifically checking for total amounts and verifying the accuracy of flagged duplicate entries.
- **Final Result:** The AI successfully generated a script that met expectations, effectively identifying the target transaction types.
- **Learnings:** The primary takeaway was that when a request is straightforward and well-defined, LLMs can be highly effective in generating functional code without the need for extensive "training" or multi-step iterative loops.
